Dreamwalker Sub Domain Brute Forcer Crack + License Keygen

Dreamwalker Sub domain brute forcer is a GUI-based application for detecting all valid sub-domains for a selected host. The tool can locate more than 2.000.000 sub-domains for a specific domain. Simply put, it tries to resolve the sub-domain's IP address by using a list of previously known valid addresses from your domain. It uses a brute-force approach to find a common solution, as it takes a list of sub-domain's IP addresses from the 'subdomains.txt' file and verifies their validity on the target host. The results are written to an output file that can be easily imported to a spreadsheet or database.

This product is designed to work against Windows servers, such as IIS, Apache and Oracle. If these hosts don't respond with a HTTP 404 response, then they have valid active sub-domains for your specified domain. Requirements: - MS Windows XP or higher; -.NET Framework 2.0; - WMP 8 or higher. Usage: Start the product once, then enter the target host in the 'Host IP' text box and click the 'Scan' button.

What's new: Version 1.0: Initial Release. Support Tickets: Please note that this is a free product and you are never asked to upgrade to a premium version. Dreamwalker Sub Domain Brute Forcer

Proactive sub-domain brute forcer is an advance tool that takes advantage of features provided by both DNS records and HTTP protocol to quickly scan the network for unsecured sub-domains of a given domain. It works just like a dictionary hack. If a sub-domain is found, it sends out a request to the server. The server is supposed to return a special response code and this is the basis of our check. When we have a valid response from the server we use the response code returned to find the domain name. The main feature of the tool is that this procedure is completed in less than a second. Any website owner can gain high security level for his or her websites by using this utility, even when a lot of time is required to find sub-domains. Key Features :*

- Scan sub-domain for a host Brute Force DNS Sub-Domain Record Search High Availability

What's New: - Version 1.3: This version fixes some issues in the previous versions. - Version 1.2: This version has some bugfixes. Dreamwalker Sub domain brute forcer is an advance tool that takes advantage of features provided by both DNS records and HTTP protocol to quickly scan the network for unsecured sub-domains of a given domain. What's New in the Dreamwalker Sub Domain Brute Forcer?

Dreamwalker Sub Domain Brute Force (SSDB) is an application that simulates a dictionary attack against a specific host and retrieves all the valid sub-domains. It includes a text file, named subdomains.txt, which needs to be saved in the same directory as the executable. When the scanner is launched, the program automatically checks the file subdomains.txt for all the valid subdomain strings and creates a subdomain based on every one. It then sends a request to the server for each subdomain, in order to check its validity. The list of valid subdomains is shown on the screen and can be easily copied to the clipboard for later use. Dreamwalker Sub domain brute forcer consists of 6 main

features: * Launch a subdomain brute force attack against a specific host * Scan the subdomains.txt file for all the valid entries * List of valid subdomains found for the selected host * Validate the subdomain * Export the found subdomain to a file * Copy the found subdomain to the clipboard Ready to try out Dreamwalker Sub domain brute forcer for yourself? You can get a free trial version here: Dreamwalker Sub domain brute forcer can prove to be a handy tool in the hands of any website owner. It is designed to simulate a dictionary attack against a specific host so as to retrieve information concerning all the valid sub-domains. Straight to the point functions within a simple GUI Thanks to its forthright interface, working with this application shouldn't pose any difficulty to users. All the options are comprised within a single window, with no additional menus to deal with. Practically, your only task is to enter the target host name in the designated field of Dreamwalker Sub domain brute forcer and press the 'Scan' button. Find sub-domains for a specific host Once the scanning process is initiated, the application proceeds to checking the validity of sub-domains by using a list of pre-defined alternatives stored in the 'subdomains.txt' file. This text document is considered the dictionary list and must be placed in the same location as the main executable. Of course, you can easily add new entries to the list or remove existing ones, thus adding
